Temperature in degrees Celsius ( $^{\circ}C$ ) may be converted to degrees Fahrenheit ( $^{\circ}F$ ) as follows:

$$^{\circ}F = (1.8 \times ^{\circ}C) + 32$$

Temperature in degrees Fahrenheit ( $^{\circ}F$ ) may be converted to degrees Celsius ( $^{\circ}C$ ) as follows:

$$^{\circ}C = (^{\circ}F - 32) / 1.8$$

### ABBREVIATED WATER-QUALITY UNITS

Chemical concentration and water temperature are given only in metric units. Chemical concentration in water is given in milligrams per liter (mg/L), micrograms per liter ( $\mu g/L$ ), or nanograms per liter (ng/L). Milligrams per liter is a unit expressing the solute mass (milligrams) per unit volume (liter) of water. One thousand micrograms per liter is equivalent to 1 milligram per liter. One thousand nanograms per liter is equivalent to 1 microgram per liter. For all concentrations in this report, concentrations in milligrams per liter are about the same as for concentrations in parts per million. Specific conductance is given in microsiemens per centimeter at 25 degrees Celsius ( $\mu S/cm$  at  $25^{\circ}C$ ).

## ABBREVIATED CHEMICAL NAMES

Throughout this report, chemical elements and compounds are abbreviated according to their chemical symbols. The table below describes these.

| Symbol        | Name                     | Symbol               | Name          | Symbol         | Name      |
|---------------|--------------------------|----------------------|---------------|----------------|-----------|
| Al            | Aluminum                 | H                    | Hydrogen      | Rb             | Rubidium  |
| As            | Arsenic                  | $\text{HCO}_3$       | Bicarbonate   | Re             | Rhenium   |
| B             | Boron                    | Hg                   | Mercury       | S              | Sulfur    |
| Ba            | Barium                   | Ho                   | Holmium       | $\text{SO}_4$  | Sulfate   |
| Be            | Beryllium                | K                    | Potassium     | Sb             | Antimony  |

# **Water-quality Data from two Agricultural Drainage Basins in Northwestern Indiana and Northeastern Illinois: I. Lagrangian and Synoptic Data, 1999-2002**

By Ronald C. Antweiler, Richard L. Smith, Mary A. Voytek , John-Karl Böhlke and Kevin D. Richards

## **Abstract**

Methods of data collection and results of analyses are presented for Lagrangian and synoptic water-quality data collected from two agricultural drainages, the Iroquois River in northwestern Indiana and Sugar Creek in northwestern Indiana and northeastern Illinois. During six separate sampling trips, in April, June and September 1999, May 2000, September 2001 and April 2002, 152 discrete water samples were collected to characterize the water chemistry over the course of 2 to 4 days on each of these drainages. Data were collected for nutrients, major inorganic constituents, dissolved organic carbon, trace elements, dissolved gases, total bacterial cell counts, chlorophyll-*a* concentrations, and suspended sediment concentrations. In addition, field measurements of streamflow, pH, specific conductance, water temperature, and dissolved oxygen concentration were made during all trips except April 1999.

## **Introduction**

Scientists first recorded hypoxic, or low-oxygen, zones on the continental shelf of the northern Gulf of Mexico in the 1970s (Turner and Allen, 1982), and began systematic assessments of these zones in 1985 (Rabalais and others, 1991). Studies have concluded that nutrient loads carried by the Mississippi River are one of the dominant causes of this hypoxia (Bierman, and others, 1994; Justic and others, 1993, 1995a, b; Rabalais, 1998; Rabalais and others, 1996, 1998; Turner and Rabalais, 1991, 1994). Other studies (for example, Antweiler and others, 1996a; Goolsby and others, 1999; Carey and others, 1999; Battaglin and others, 2001) determined that one of the chief sources of these nutrients within the Mississippi River was agricultural practices in the Upper Mississippi River basin (that part of the Mississippi River basin above the confluence with the Missouri River, herein called UMRB). At the same time, modeling studies (for instance, SPARROW, Smith and others, 1997; and Howarth and others, 1996), based on current

understanding of nutrient processing in streams, indicated that large amounts of nitrate should have been removed by natural denitrification reactions within the surface waters of the UMRB, especially in the headwaters and small streams. These studies indicated that nitrate concentrations in some parts of the UMRB should be lower than they are. The apparent inconsistencies between the model results and observations led the U.S. Geological Survey (USGS) to undertake a study, in cooperation with the U.S. Department of Agriculture, to determine the sources and fate of nitrogen in representative headwaters streams of the UMRB. Accordingly, two small predominantly agricultural drainage basins of the Illinois River (one of the chief tributaries of the Mississippi River in the UMRB) were selected for in-depth intense study. These two basins are a portion of the Iroquois River in western Indiana and one of its tributaries, Sugar Creek, in western Indiana and eastern Illinois (fig. 1). The chief purpose motivating the overall study was to collect data both spatially and temporally along each of the two selected drainages, with an ultimate aim to understanding in-stream processes, particularly involving nitrogen.

## Purpose and Scope

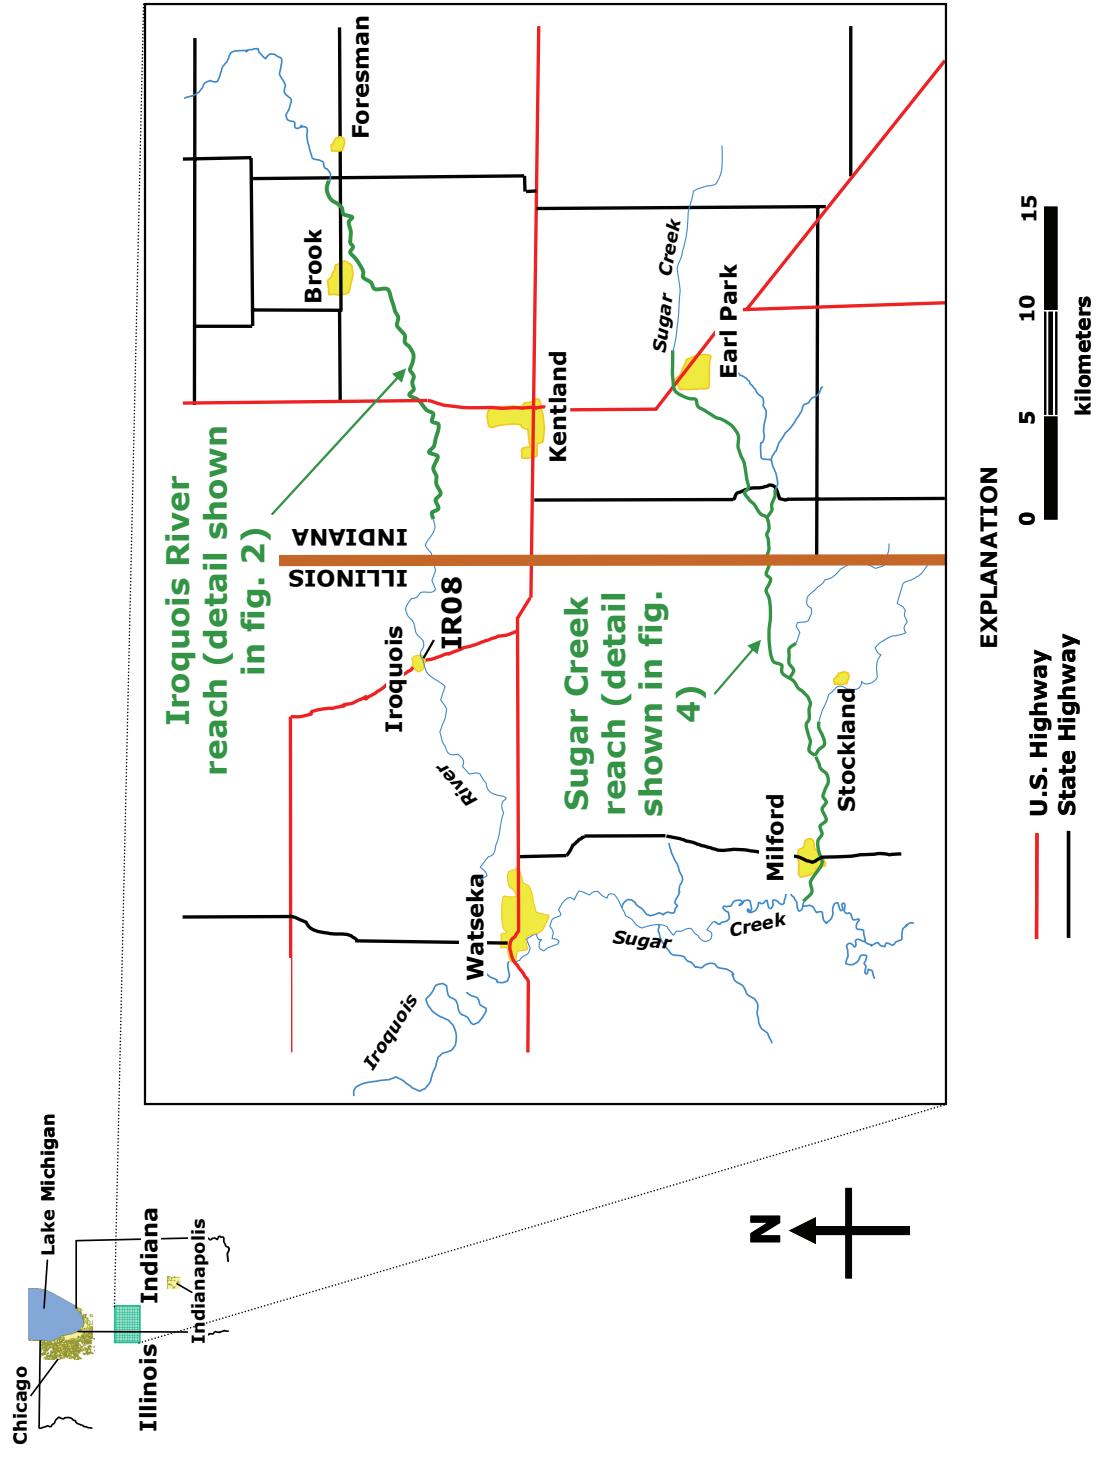

This report describes data collected along two specific reaches (one in each drainage basin) during each of six sampling trips in 1999-2002. During these six sampling trips, water samples were collected longitudinally along each reach in either a Lagrangian or synoptic manner over the course of the sampling trip, resulting in a total of 152 samples. The temporal component was examined by collecting diel data during four of these sampling trips at one specific location on each drainage (Antweiler and others, 2005a), and data from a biweekly sampling effort which spanned 28 months (Antweiler and others, 2005b). Additional work, including tracer studies, ground water analyses, and incubation studies also was performed at these sites. This report only describes the data which relate to the spatial component of the study.

## Acknowledgments

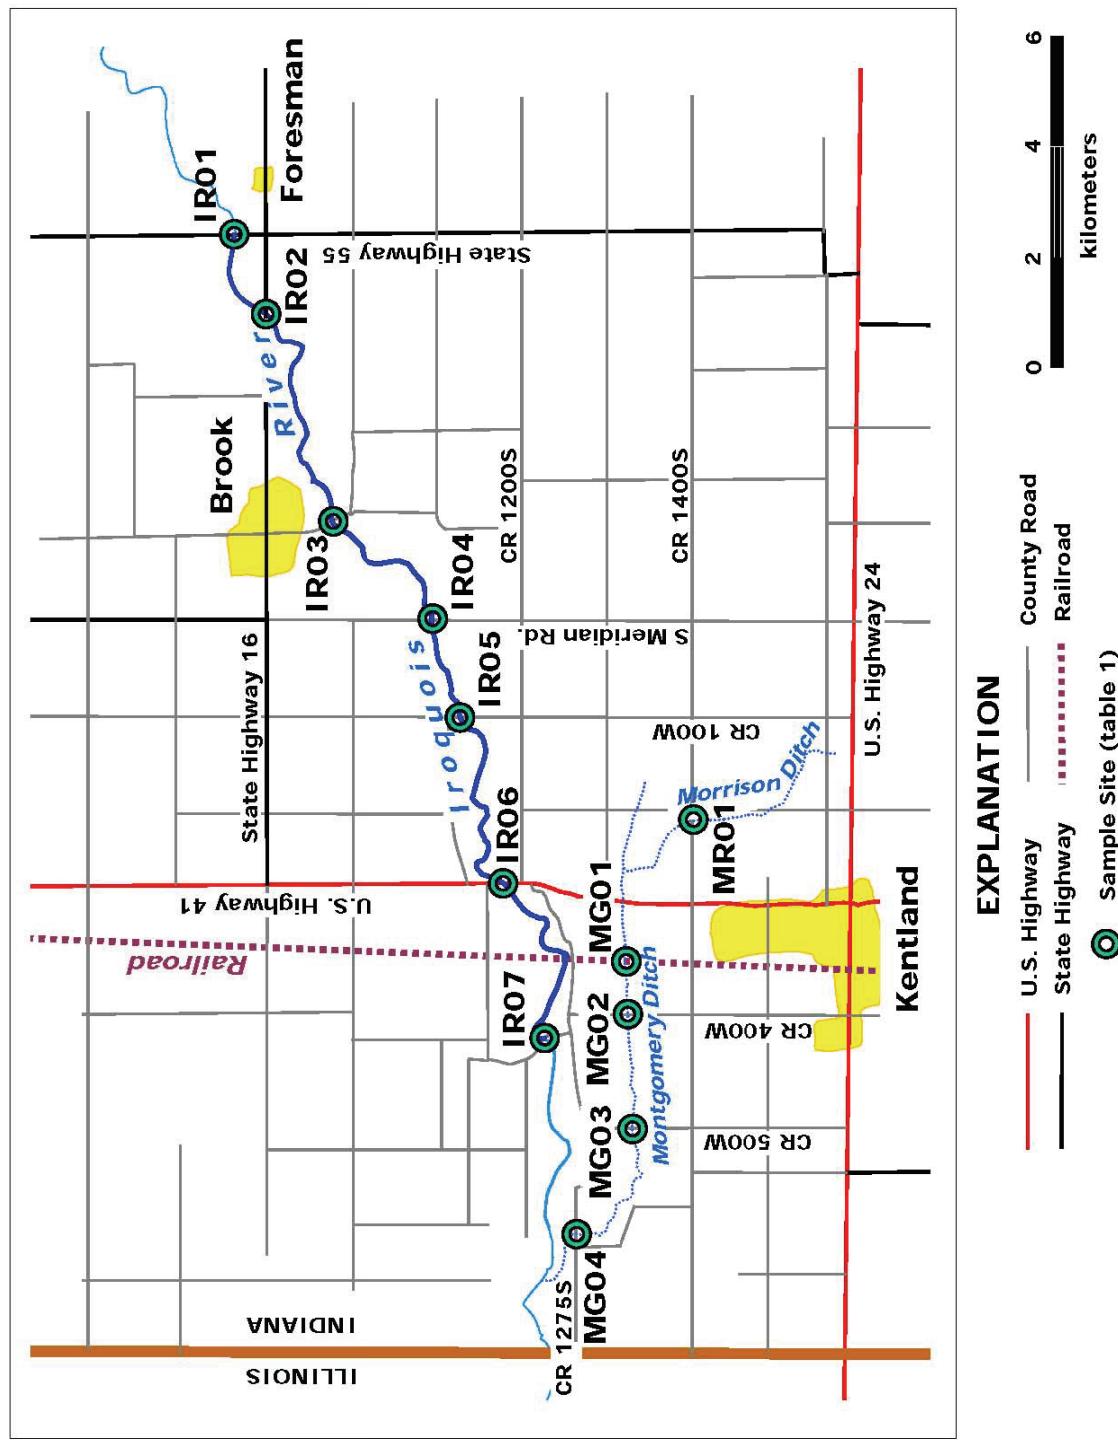

We wish to thank the contributions of Ronald Knapp and Brad Reinking of the USGS Indiana Water Science Center; George Groschen, Mike Friedel, Steve Stammer and Dave Dupré of the USGS Illinois Water Science Center; JoAnn Holloway, Terry Plowman, Dave Roth, Dale Peart, Howard Taylor, Ryan Bonelli, Julie Kirshstein, Seanne Buckwalter, and Deb Report of the USGS National Research Program; Charles Patton of the USGS National Water Quality Laboratory; and Andy Laursen of Rutgers University. We also wish to thank George Groschen and Phillip Verplanck for their technical reviews of the manuscript.

## Sampling Locations

Figure 1 shows the location of the two study reaches. The Iroquois River reach went from the USGS stream gage near Foresman, Ind. (USGS stream gage number 05524500) – where Indiana State Highway 55 crosses the river approximately 5 kilometers east of Brook, Ind. – to the Newton County (Ind.) Fairgrounds bridge crossing approximately 6 kilometers north of Kentland, Ind. This reach spanned approximately 21 kilometers of the river and consisted of seven sampling sites, which were (more or less) evenly spaced (fig. 2). Along this reach, there are no perennial surface water additions to the river (that is, tributaries) although during the spring runoff there are numerous ditches and pipes that drain into it. The sampling sites were established where bridges crossed the river, mainly because of accessibility and sampling logistics. Detailed descriptions of the location of the sampling sites can be found in table 1. Figure 3 shows the Iroquois River at two of the sampling sites in April 2002, during high flow.

**Figure 1.** Location of the two study reaches

**Figure 2.** Location of the sampling sites in the Iroquois River reach.

**Figure 1.** Photographs of the Iroquois River in April 2002. (A) View looking downriver at IR01, State highway 55 bridge, near Foresman, Ind. Channel is about 40 meters wide; (B) View looking downriver at IR07, Newton County (Ind.) Fairgrounds bridge. Channel is about 50 meters wide.

The Sugar Creek study went from the CR 400W bridge crossing in Benton County, Ind., approximately 2 kilometers northeast of Earl Park, Ind. to just above (approximately 100 meters) the confluence of Mud Creek 3, about 2 kilometers west of Milford, Ill. This reach spanned approximately 38 kilometers of the creek and consisted of 10 sampling sites (fig. 4). Each of the sampling sites except the last occurred at bridge crossings. Two perennial tributaries enter the creek along this reach and each was sampled. Unfortunately, both of these tributaries – along with the tributary just beyond the reach – were named Mud Creek. Thus, there are three Mud Creeks which enter Sugar Creek within the span of 30 kilometers. For clarity, the first Mud Creek, which enters Sugar Creek approximately 2 kilometers east of the Illinois-Indiana state line, is referred to as Mud Creek 1; the second Mud Creek, which enters Sugar Creek about 5 kilometers west of the state line, is referred to as Mud Creek 2. The third Mud Creek, which enters Sugar Creek beyond the reach, is referred to as Mud Creek 3. Each of the first two Mud Creeks was sampled as closely as possible to its confluence, but Mud Creek 3 was not sampled. In addition, a large (unnamed) tributary (SCT3), that contained water even into the summer, was sampled during four of the six trips. This ditch enters Sugar Creek about 4 kilometers to the east of Milford, Ill. Detailed descriptions of the location of the sampling sites can be found in table 1. Figure 5 shows Sugar Creek at two of its sampling sites in April 2002.

In addition to the samples collected at the sites described above, this report also contains the analyses from eleven grab samples collected at seven drainage ditches and tile drain pipes in the vicinity of the Iroquois River and Sugar Creek drainages. Detailed descriptions of the location of these samples can be found in table 2, and their locations can be found on the maps in figures 1-3.

## **Sampling Times and Types**

Data were collected during six sampling trips, three of which were Lagrangian and three of which are designated as synoptic. As used in this report, “Lagrangian sampling” refers to sampling which attempted to follow a parcel of water as it moved downstream. Thus, sampling times were dictated by the velocity of the water in each reach, and occurred whenever it was estimated that the water parcel had arrived at the sampling site (even if this happened in the middle of the night). The three sampling trips which are called “Lagrangian” occurred June 22-26, 1999, September 13-15, 1999, and May 8-11, 2000.

As used in this report, “synoptic sampling” refers to sampling which attempted to collect samples at all sites along a given reach as closely as possible to the same time. Because of logistical reasons, it typically took as many as about 8 hours to collect synoptic samples along each reach. The three sampling trips which are designated as “synoptic” occurred April 20, 1999, September 12-13, 2001, and April 3-4, 2002. The April 1999 sampling trip was actually a reconnaissance trip and therefore consisted of only five sampling sites on the Iroquois River and two on Sugar Creek; in addition, because it was a preliminary assessment, the complete set of samples which was collected during the other trips was not collected during this trip. Table 3 summarizes the sampling times for all of the samples described in this report.

## **Methods of Collection**

Samples were collected at twenty sites on the two reaches, seven on the Iroquois River, ten on Sugar Creek, and three on separate tributaries of Sugar Creek (table 1). Concurrent with the collection of samples for analysis, streamflow measurements were made at each site using standard USGS protocols (Rantz and others, 1982). This involved selecting between 15 and 25 vertical measurement locations across the channel, measuring the water depth and average velocity at each vertical, and integrating over all verticals in a section to obtain the total streamflow. During the April 1999 trip, streamflow measurements were not made; at this time, water discharge on the Iroquois River was estimated at the sampling sites by interpolating between instantaneous (and automatic) measurements made at two USGS stream gaging stations, one upstream (the Iroquois River near Foresman, Ind., USGS stream gage number 05524500) and the other downstream (the Iroquois River at Iroquois, Ill., USGS stream gage number 05525000).

In addition to streamflow, field measurements of pH, specific conductance, dissolved oxygen concentration, and water temperature were made and recorded. The pH, specific conductance, dissolved oxygen concentration, and water temperature were all measured using a YSI Model 600XL-4 parameter instrument which was calibrated daily against known standards according to standard USGS protocols (Wilde and Radtke, 1998). There were two main types of samples collected: the composite sample and the grab sample.

### **Composite Samples**

“Composite” samples were depth- and width-integrated, collected either with a D77 sampler, or, if the river was wadeable, with a hand-held DH-81 sampler (Horowitz and others, 1994; Wilde and others, 1999). Water samples were collected at five to seven equally-spaced vertical intervals using a collapsible Teflon bag. The collection vessel had a Teflon nozzle and was oriented to always be facing upstream. Transit rates were held constant during the collection of a sample (Moody and Meade, 1992; Kelly and Taylor, 1996). The Teflon bags were either 1-L or 2-L (depending on the type of sampler used) and were emptied into a clean 8-L Teflon-coated churn. The Teflon bags were filled a sufficient number of times to collect about 6-L of water in the churn. Samples collected in this manner represent an integrated “snapshot” of the river at the time of collection, both for dissolved and particulate materials.

### **Grab Samples**

“Grab” samples were normally collected into a pre-cleaned 2-L Teflon bottle by going to the center of flow of the channel and lowering the bottle into the water. The bottle was rinsed with river water, then filled and emptied into a clean 8-L churn three times to yield a total of 6-L of water. Grab samples only represent a true snapshot of the river if the water at the time of collection is well-mixed. In general, this rarely occurs in large rivers, especially for particulates (Meade, 1985; Moody and Meade, 1992); however, grab samples collected from the center of flow are often representative of the chemistry of the stream at that point in small watersheds and especially for dissolved constituents.

The first sampling trip (April 1999) was a reconnaissance, and all samples collected at that time were grab samples. During the second sampling trip (June 1999), both composite and grab samples were collected at all sites on both reaches. During the third trip (September 1999), composite samples were collected from the Iroquois River and grab samples were collected from

Sugar Creek. On the fourth trip (May 2000), composite and grab samples were each taken at all sites on the Iroquois River, and only grab samples were collected at all sites on Sugar Creek. Only grab samples were collected during the fifth and sixth trips (September 2001 and April 2002). In addition, on the April 2002 trip, at selected sites, grab samples were collected across the entire channel and in the backwater areas (in addition to collecting at the center of flow). These samples were collected to assess the cross-channel variability.

Additional samples were collected for dissolved gas analyses during four of the six sampling trips (all except the reconnaissance trip – April 1999 – and the last trip, April 2002). Samples collected for dissolved nitrous oxide and methane (samples for methane analysis only were collected during the September 2001 synoptic trip) were collected by one of two methods. Samples labeled as composite were collected from three equally-spaced vertical intervals (as above) using a peristaltic pump. The pump tubing was attached to a wading rod and water samples were slowly pumped from the top, middle, and bottom of each depth interval (or two depths for shallow locations). For grab samples, which were collected in duplicate or triplicate, water was obtained from the center of flow in a bucket. All water samples were collected in plastic syringes, taking care to exclude air bubbles. After filling, a needle was placed on the syringe and 20 mL injected into 30-mL serum bottles that had been fitted with thick butyl rubber stoppers and aluminum crimps and which contained 0.2 mL 12.5 normal sodium hydroxide and a helium (He) headspace.

## Processing of Samples

After either grab or composite samples were collected into the cleaned churn, the churn was transported immediately from the sample site to the field laboratory (located in Kentland, Ind., less than 30 minutes away from all sample sites, fig. 2 and 3). Upon arrival at the field lab, the 6 liters were churned and subsampled by the following method. First, a 250-mL polyethylene bottle was filled for the determination of total suspended sediment. This sample was chilled after subsampling until analysis. Second, a 19-mL aliquot was subsampled by decanting from the churn spigot into a 20-mL glass bottle pre-dosed with 1 mL of formalin for the determination of total bacterial count. This sample was stored at room temperature for as many as 4 days and thereafter at 4°C until analysis.

Third, a 1-L pre-cleaned Teflon bottle was filled and filtered through a 47-mm diameter, 0.4-µm nominal pore-size glass fiber filter (GFF). The volume of water passing through the filter was recorded. The filtrate was disposed, and the GFF was frozen for chlorophyll-*a* analysis.

Fourth, a 2-L Teflon bottle was filled from the churn. The entire contents of this bottle were filtered through a 0.2-µm Gelman spiral-cap capsule filter. Out of these 2 liters, the first 400-500 mL of filtrate were discarded to acclimate the filter. Then, the following filtered aliquots were collected into pre-cleaned bottles: (1) 120 mL for trace metal analysis; this bottle was acidified with 1 mL of doubly-distilled trace-metal grade nitric acid; (2) 120 mL for mercury analysis; this bottle was preserved with 5 mL of a potassium dichromate-nitric acid solution; (3) 120 mL for nutrient analyses; this aliquot was refrigerated to 4°C immediately after filtration; (4) 60 mL for anions analysis; this aliquot was refrigerated to 4°C immediately after filtration; (5) 60 mL for dissolved organic carbon (DOC) analysis; as with anions and nutrients, this aliquot was refrigerated to 4°C after filtration.

## **Methods of Analysis**

All samples were analyzed at USGS laboratories, the National Research Program (NRP) laboratories located in Boulder, Colo., the NRP laboratories located in Reston, Vir., and the National Water Quality Laboratories (NWQL) in Lakewood, Colo. Table 4 summarizes the methods of analysis, and also includes the method detection limits for each chemical constituent (where applicable).

### **Nutrients**

Dissolved nitrate, nitrite, ammonium, and phosphate were determined at the USGS NRP laboratories in Boulder, Colo. in duplicate or triplicate colorimetrically on an air-segmented continuous-flow Alpkem RFA 300 system according to the methods of Antweiler and others (1996b). Nitrate plus nitrite was determined colorimetrically at 543 nanometers (nm) by diazotization with sulfanilamide and reaction with N-(1-naphyl) ethylene diamine (Greiss reaction) after reduction to nitrite with cadmium metal. Nitrite was determined by the same method without cadmium reduction. Nitrate was then computed by difference. Ammonium ion was determined colorimetrically at 660 nm by the salicylic acid analog of the indophenol blue method. Phosphate was determined at 880 nm by the phosphoantimonyl molybdenum-blue procedure. Every eight to ten determinations, standard reference samples were analyzed to assess the quality of the analyses.

Dissolved Kjeldahl nitrogen was determined at the USGS NWQL in Lakewood, Colo. by the method of Patton and Truitt (2000). In this method, organic nitrogen is converted to ammonium ions at a temperature of 370 °C with sulfuric acid, potassium sulfate and mercury (II). Therefore, in this report, Kjeldahl nitrogen refers to ammonium ions plus organic nitrogen (Patton and Truitt, 2000). Due to cost considerations, not all samples were submitted for Kjeldahl nitrogen analysis.

Total phosphorus was determined at the USGS NRP laboratories in Boulder, Colo. by inductively-coupled atomic emission analysis at 213.617 and 214.914 nm on a Perkin Elmer Optima 3300DV, multichannel emission spectrometer, using the axial view mode. Details of the system are given in Mitko and Bebek (1999, 2000).

### **Anions and DOC**

Dissolved chloride, nitrate and sulfate were determined at the USGS NRP laboratories in Boulder, Colo. by ion chromatography on a Dionex 2002i/SP series ion chromatograph, using a carbonate-bicarbonate eluent buffer. Samples were (in general) analyzed only once, but each analysis run had at least 20 percent quality-control and standard reference samples to assess both accuracy and precision. Details of the analytical techniques can be found in Brinton and others (1996).

Total alkalinity was determined in the USGS NRP Boulder, Colo. laboratory by titration with 0.1 M sulfuric acid to a fixed point endpoint according to the techniques of Kramer (1982) using a Gran's titration calculation. Standard reference water samples were analyzed at least 20 percent of the time to assess accuracy and precision.

Table 4. Detection limits and methodologies used for the determination of chemical constituents in this study.

[mg/L, milligrams per liter; mg C/L, milligrams per liter as carbon; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; µg/L, micrograms per liter; µg C/L, micrograms per liter as carbon; ng/L, nanograms per liter; ICPMS, Inductively-coupled plasma-mass spectrometry; ICPAES, Inductively-coupled plasma-atomic emission spectrometry; GC, gas chromatography; IR, infrared; IC, ion chromatography; CVAFS, cold-vapor atomic fluorescence spectrometry]

| Chemical constituent | Method          |        |              | Chemical constituent | Method          |        |                |

Dissolved organic and inorganic carbon (DOC and DIC) were determined at the USGS NRP laboratories in Boulder, Colo. on an O.I. Analytical Model 700 carbon analyzer. First, DIC was determined by acidification of the sample with phosphoric acid and subsequent purgation of the resulting carbon dioxide gas by nitrogen. This was then measured by an infrared absorption spectrophotometric technique (Wershaw and others, 1983). Following removal of the inorganic carbon, the DOC was determined by oxidation with potassium persulfate and acidification to carbon dioxide.

### **Major Cations, Silica and Trace Elements**

Elements present at concentration levels in the milligram per liter range, including Ca, K, Mg, Na, and SiO<sub>2</sub> and some selected elements, such as Fe and P, were determined at the USGS NRP laboratories in Boulder, Colo. Samples were analyzed in triplicate by inductively coupled plasma-atomic emission spectrometric (ICP-AES) techniques utilizing a Perkin Elmer Optima 3300DV, multichannel emission spectrometer. Use of the dual-view (radial and axial) optical configuration provided optimal sensitivity for various elements regardless of concentration. A general description of the analysis conditions and procedures are reported by Garbarino and Taylor (1979). Details of the operational conditions are described by Mitko and Bebek (1999, 2000). All analysis runs contained at least 20 percent quality-control standard reference samples to assess accuracy. Precision was assessed by the fact that all samples were analyzed in triplicate.

Trace elements (excluding Hg) were analyzed at the USGS NRP laboratories in Boulder, Colo. in triplicate on undiluted field preserved samples with a Perkin Elmer Elan Model 6000, inductively-coupled plasma-mass spectrometer (ICP-MS). Aerosols of HNO<sub>3</sub>-acidified aqueous samples were introduced into the spectrometer with a cone-spray pneumatic nebulizer. Multiple internal standards (indium, iridium and rhodium), covering the mass range of measured analytical isotopes were used to normalize the system for drift. Details of the specific analysis techniques, procedures, and instrumental settings are described elsewhere (Garbarino and Taylor, 1996; Taylor, 2001). All analysis runs contained at least 30 percent quality-control and standard reference samples to assess accuracy.

Trace concentration levels of total dissolved Hg (all forms) were measured in triplicate at the USGS NRP laboratories in Boulder, Colo. using an automated cold-vapor atomic fluorescence spectrometric method utilizing a PS Analytical Millennium System mercury analyzer. Details of the method have been described previously by Roth (1994) and Roth and others (2001). Elemental Hg vapor was produced by chemically reducing Hg in the sample with excess stannous chloride. The resulting vapor was transported to the detector with a stream of argon gas. All analysis runs contained at least 20 percent quality-control and standard reference samples to assess accuracy.

### **Dissolved Gases**

Dissolved gases were measured at the USGS NRP laboratories in Boulder, Colo. Nitrous oxide was measured as described by Brooks and others (1992) with an HNU model GC 301 Gas Chromatograph equipped with an electron capture detector. Methane was measured with a Shimadzu model GC 17A Gas Chromatograph fitted with a flame ionization detector and a 2.44 m Porapak N (80/100 mesh) column using He carrier gas at 100 °C. Aqueous concentrations of nitrous oxide and methane were calculated using Bunsen solubility coefficients (Weiss and Price, 1980; Yamamoto and others, 1976).

## **Total Bacterial Cell Counts**

Total bacterial cell counts were made at the USGS NRP laboratories in Reston, Vir. according to the method of Porter and Feig (1980) and are summarized here. A black Nucleopore 25-mm diameter, 0.2- $\mu$ m nominal pore-size polycarbonate membrane filter was placed on top of a damp 0.45- $\mu$ m Millipore support filter mounted on a glass filter frit with filter tower attached. One mL of the sample was added to the filter tower and DAPI (4'6-diamidino-2-phenylindole) was added to 0.01  $\mu$ g/mL and incubated for 5 minutes at room temperature. Gentle vacuum was applied to concentrate the sample onto the filter. The filter was washed twice with sterile salt solution and the filter was removed and placed damp onto a microscope slide to which one drop of low fluorescing immersion oil had been added. The filter was covered with a glass coverslip which also contained one drop of immersion oil, and at least 8 fields in the range of 40 cells/field were counted at 100X magnification (oil immersion) on a Zeiss epifluorescent microscope fitted with an ocular grid of known area. If the cell concentration was too high for optimal counting on the microscope a dilution of sample was performed, and counted as described.

## **Chlorophyll-a**

Chlorophyll-*a* analyses were performed at the USGS NRP laboratories in Reston, Vir. Glass fiber filters, which were frozen immediately following sample processing, were thawed in low light and placed in a glass tube tissue grinder. All processing was performed at low light. Four mL of 90 percent acetone (HPLC grade) was added, and the filters were pulverized in the tissue grinder using a pestle and keeping the grinder on ice at all times. The filter/acetone mixture was poured off into a 15 mL centrifuge tube, and the grinder was rinsed with 2 mL 90 percent acetone, which also was added to the centrifuge tube. The sample was incubated in the dark at 4°C for 16-20 hours. Sample tubes were brought to room temperature and centrifuged at 1,000g for 5 minutes to clarify the solution. The solution was poured into a glass tube and the fluorescence was measured using a Turner Model 10 fluorometer equipped with excitation filter 436FS10 and emission filter 680FS10, specific for chlorophyll-*a*. Complete details of the procedures are given in Arar and Collins (1997).

## **Suspended Sediment**

Suspended sediment concentration determinations were made at the USGS NRP laboratories in Boulder, Colo. The filled sample bottle was first weighed. Then, a new pre-weighed 47-mm Whatman 41 paper filter was placed on a filter stand and the sample was filtered through it. The filter was oven-dried overnight at 95 °C, allowed to cool, and re-weighed. The empty sample bottle was reweighed as well. The suspended sediment concentration was calculated as the difference in weights of the filter divided by the difference in weights of the sample bottle (converted to units of milligrams per liter).

## **Quality Control/Quality Assurance**

### **Accuracy and Precision**

The quality of the data for trace metals, major cations and anions, and nutrients was assessed by a vigorous program involving a large number of quality-control (QC) standards, which were analyzed as unknowns during the analysis of all samples collected during the study. The frequency of analysis of these QC standards was variable depending upon the methodology used, but was always at least 20 percent of the total number of samples collected. Tables A1-A6 in Appendix A contain the results of these analyses, with each table representing a distinct sampling trip. The

columns of these tables are ordered alphabetically for each element or compound for which standards existed. The italicized rows in each table list the published “Most Probable Values” (MPVs) of each standard; the non-italicized rows list the median values for each analysis run, along with the number of times that standard was analyzed during the run. Elements or compounds for which no MPV existed are displayed in the tables with “na” (“not applicable”).

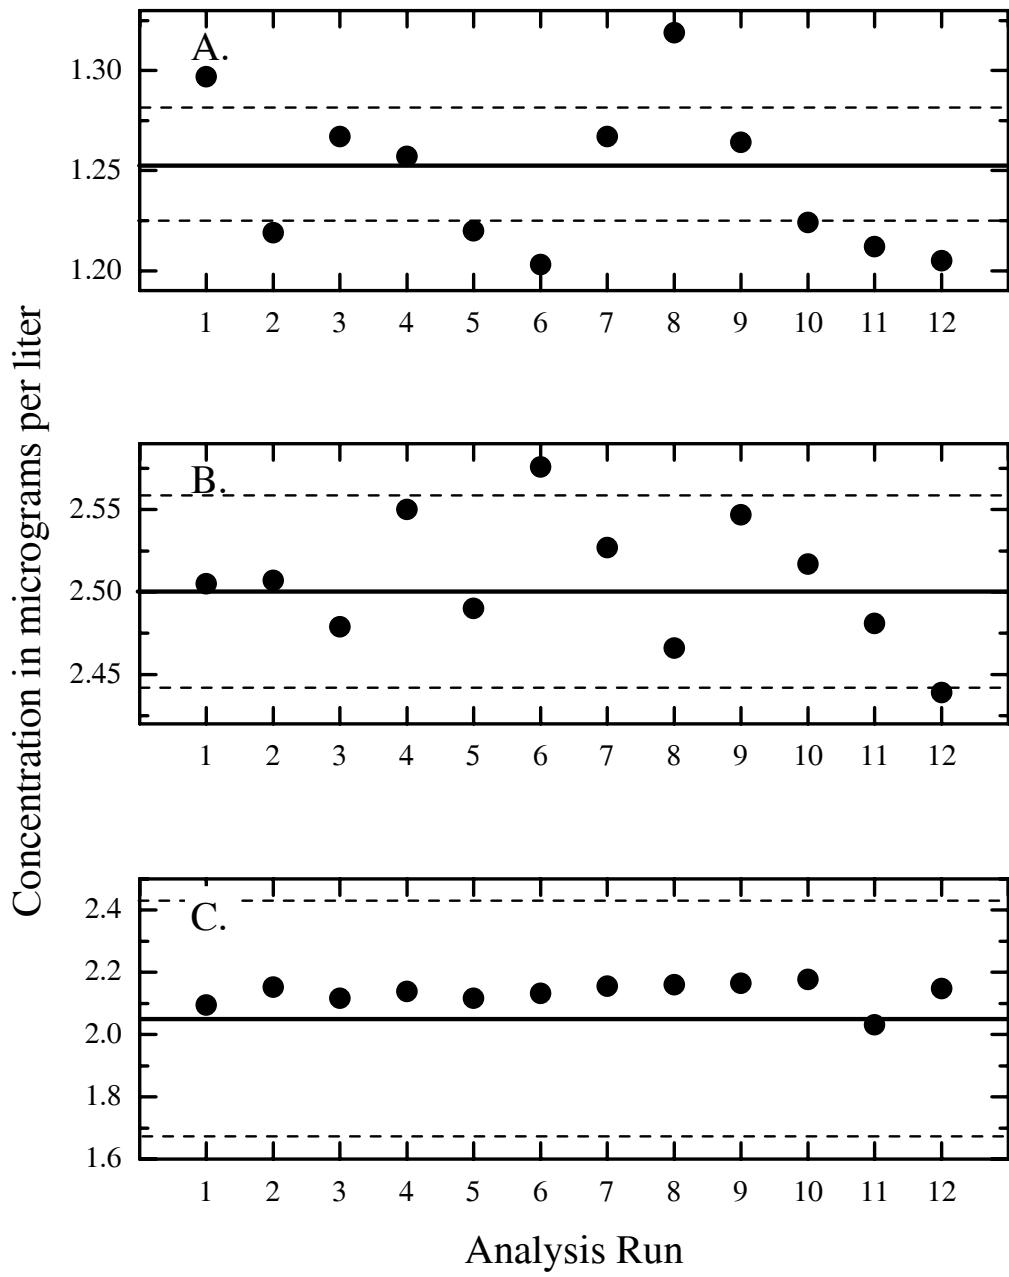

The large amount of data in these tables cannot be easily reduced, but figures 6-8 display representative portions of them, and indicate the agreement between the observed concentrations and their respective MPVs for a number of elements and compounds. These figures and the data in the tables suggest that the data collected during the study are appropriate for the objectives of the study.

## Field Blanks

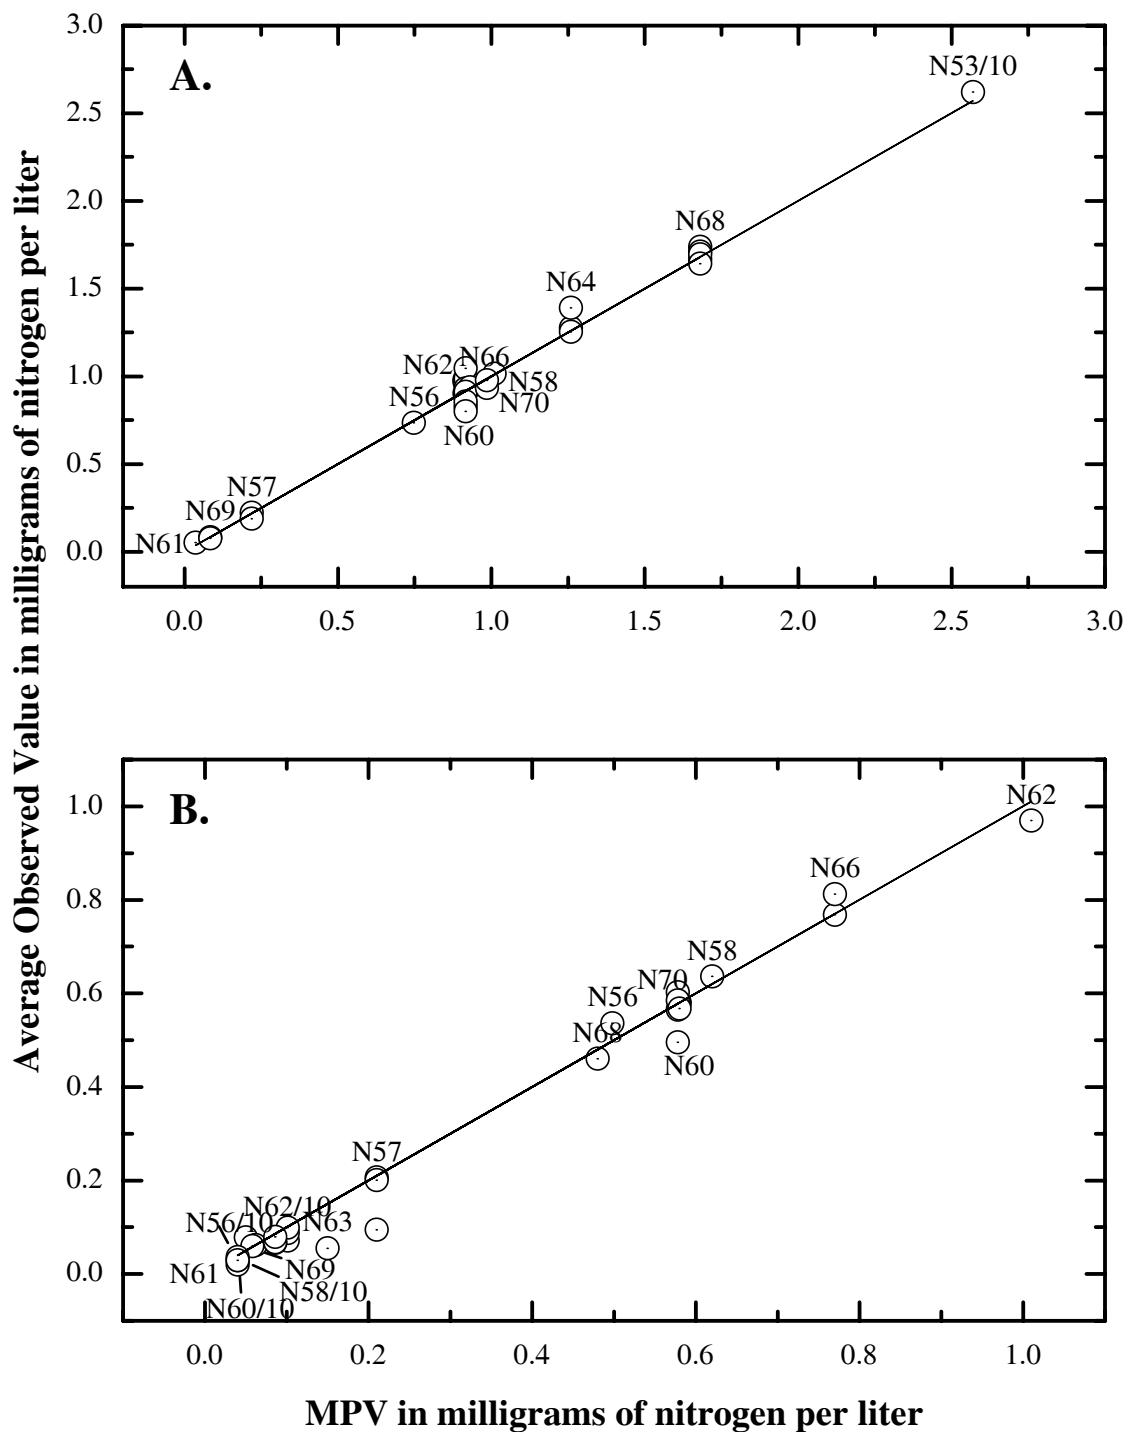

Field blank samples were collected during the June 1999, September 1999, and May 2000 sampling trips to evaluate whether field procedures could have introduced contamination into the samples. These data are presented in table A7 in Appendix A. During the June 1999 trip, three sets of field blanks were taken: (1) a source deionized (DI) water sample from a Millipore corporation MilliQ Plus deionized water system. This source water was used to rinse all equipment between samples; (2) a churn blank, in which source DI water was poured into the churn used for sample collection, churned and sampled; and (3) a filter blank, in which source DI water was passed through the 0.2- $\mu\text{m}$  Gelman filter and sampled. Blank samples collected during the September 1999 trip included these three samples, but also included a sample of water purchased from a local market which claimed to be deionized water and which was used to pre-rinse equipment before a final rinse was done with the MilliQ DI water. In addition, a “process” blank sample was taken, in which MilliQ DI water was poured into a churn, churned, collected into a holding bottle and subsequently filtered through a 0.2- $\mu\text{m}$  Gelman filter. The blank samples taken during the May 2000 trip additionally included a holding bottle blank, in which source DI was poured into one of the bottles used transfer samples from the churn to the Gelman filter.

## Lagrangian and Synoptic Water-Quality Results

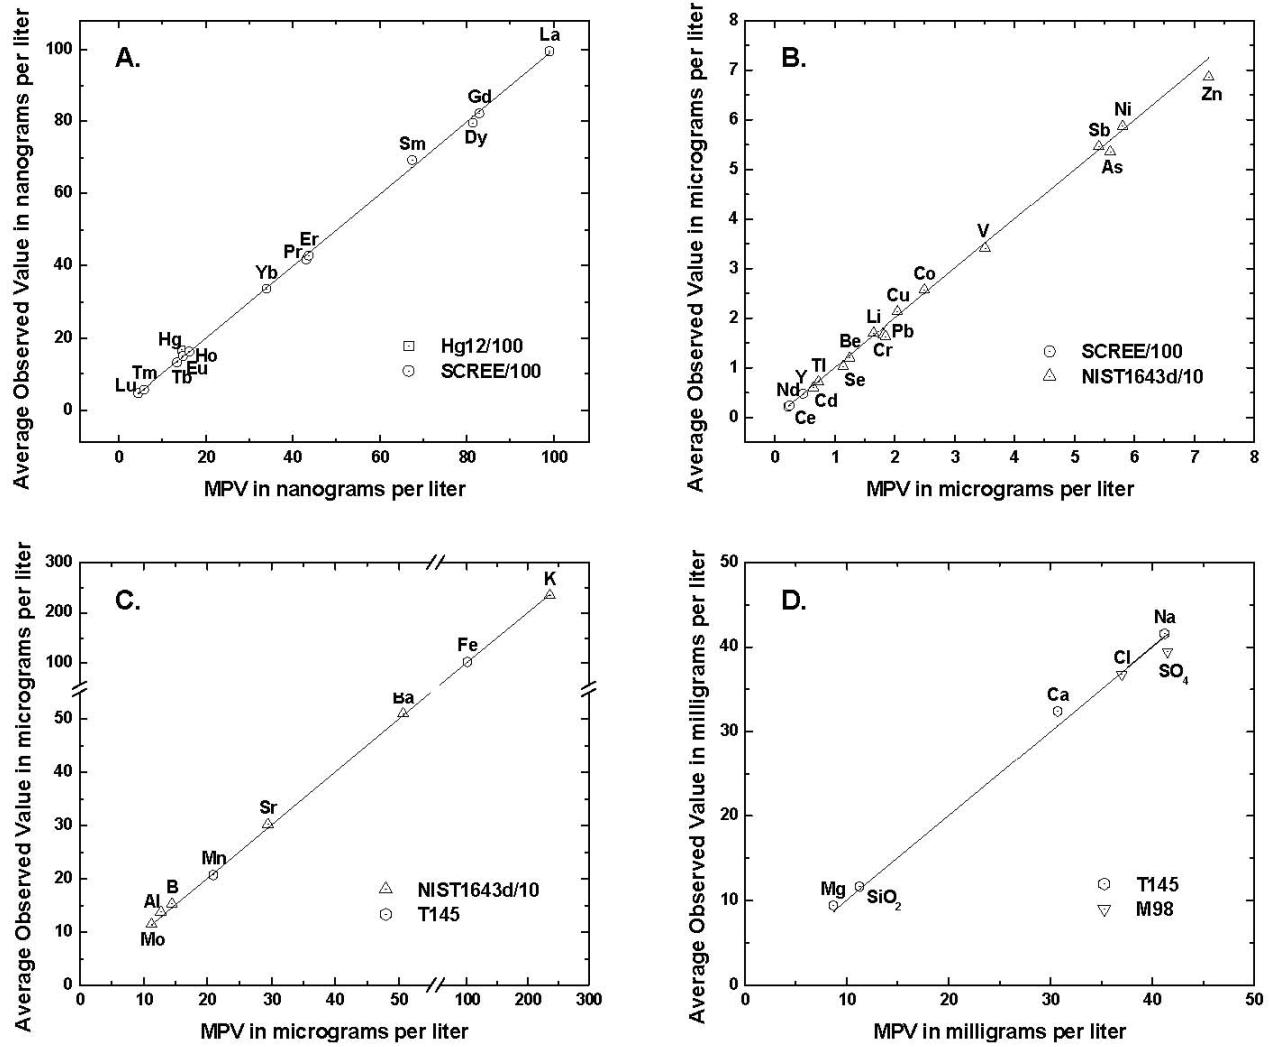

Tables A8-A42 in Appendix A contain the results of all analyses for the Lagrangian and synoptic samplings. The general structure of the tables is as follows. All results from the April 1999 reconnaissance are presented first (tables A8-A10). Next, all the results from the June 1999 sampling trip are presented (tables A11-A19), followed by September 1999 (tables A20-A24), May 2000 (tables A25-A29), September 2001 (tables AQ30-A34) and finally April 2002 (tables A35-A38). For each sampling trip, the tables are ordered so that Iroquois River data are presented first, followed by Sugar Creek data and finally by the Sugar Creek tributaries. In general, nutrient, DOC, dissolved gases and suspended sediment data are presented first, followed by major inorganic constituents, trace elements, field measurements, and finally, total bacterial cell counts and chlorophyll-*a* concentrations. The miscellaneous data collected from various ditches, tile drains, and other sites are presented in tables A39-A42. The order of presentation of data by sample site in these tables is similar to that described above.

**Figure 2.** Quality-control charts of the NIST1643d standard (1:10 dilution) for each analysis run of the entire study. The solid points represent the average value of the standard for that analysis run. The solid line is the certified value, and the dashed lines represent the published uncertainty (National Institute of Standards and Technology, 1995). (A) Beryllium; (B) Cobalt; (C) Copper

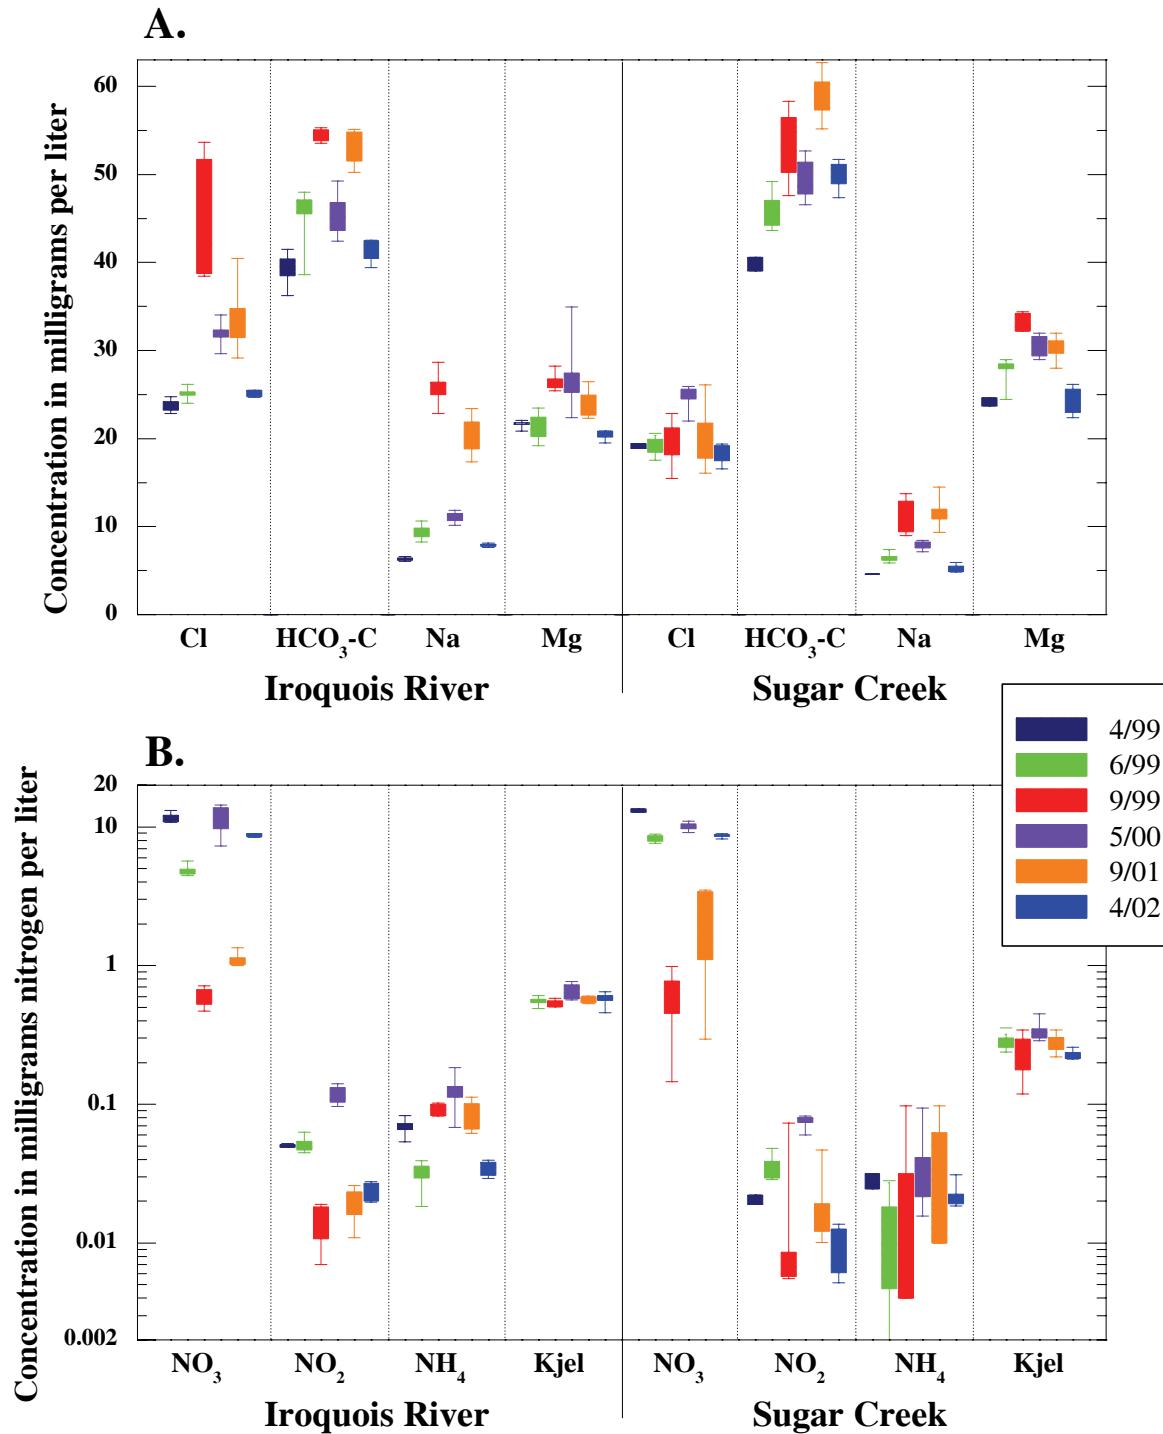

**Figure 3.** Most Probable Values (MPVs) and average observed concentrations for all nutrient standard reference materials used in this study. (A) Nitrate; (B) Ammonium

**Figure 8.** Most Probable Values (MPVs) and average observed concentrations for the first analysis run of the September 1999 data. The line is the line of perfect agreement between the MPV and the observed value. (A) Rare-earth elements and mercury (Hg); (B) Trace elements; (C) Lower concentration elements; (D) Major constituents.

The ranges of concentrations of selected major constituents can be seen in figure 9A. Chloride concentrations in the Iroquois River ranged from 23 to 55 mg/L, with highest values occurring in September 1999 and 2001. Concentrations of chloride in Sugar Creek tended to be lower, ranging from 16 to 26 mg/L. Bicarbonate concentrations for both drainages ranged from 35 to 63 mg C/L, and sulfate (not pictured in figure 9A) ranged from about 40 to 120 mg/L. Sodium concentrations in both drainages were highest during the September 1999 and 2001 sampling trips, and, relative to calcium (not pictured in figure 9A) and magnesium tended to have lower concentrations.

**Figure 5.** Box plots showing the concentration ranges of data for the Iroquois River and Sugar Creek for (A) Major cations and anions, expressed in milligrams per liter: chloride (Cl), bicarbonate (as carbon, HCO<sub>3</sub>-C), sodium (Na) and magnesium (Mg); (B) Nutrients, expressed in milligrams nitrogen per liter: nitrate (NO<sub>3</sub>), nitrite (NO<sub>2</sub>), ammonium (NH<sub>4</sub>), and Kjeldahl nitrogen (Kjel). Colors of the bars represent the sampling trip.

Selected nutrient concentrations (plotted on a logarithmic axis) are graphed in figure 9B. In contrast to chloride and sodium, lowest concentrations of nitrate occurred during September 1999 and 2001 on both drainages. During the other sampling trips, nitrate concentrations were far greater than all other nitrogen species, ranging from 4 to 13 mg N/L on both drainages. Kjeldahl nitrogen was very consistent, ranging from 0.2 to 0.6 mg N/L for all data, and showing little difference between sampling trips. Nitrite and ammonium concentrations were always less than 0.2 mg N/L for both drainages.

Trace element concentrations tended to be low. For example, arsenic concentrations ranged from 0.3 to 2.2 µg/L, copper concentrations from 0.3 to 1.8 µg/L and antimony concentrations from 0.06 to 0.17 µg/L.

Chlorophyll-*a* concentrations ranged from 4.0 to 13.6 µg/L in the Iroquois River and from 1.7 to 10.5 µg/L in Sugar Creek. Sugar Creek concentrations tended to be lower than the Iroquois River.

## Summary

This report contains the results of analyses made for Lagrangian and synoptic sampling during six trips ranging from April 1999 to April 2002. The Lagrangian sampling occurred June 22-26, 1999, September 13-15, 1999, and May 8-11, 2000. The synoptic sampling occurred April 20, 1999, September 12-13, 2001, and April 3-4, 2002. For each trip, samples were taken on two study reaches, one spanning 38 kilometers along Sugar Creek in northwestern Indiana and northeastern Illinois, and the other spanning 21 kilometers on the Iroquois River in northwestern Indiana. Measured field parameters included streamflow, pH, specific conductance, water temperature and dissolved oxygen concentration. Methods and results are reported for major inorganic constituents, trace elements, nutrients, dissolved organic carbon, dissolved gases, suspended sediments, total bacterial cell counts, and chlorophyll-*a*. This report also contains the results of an extensive quality control/quality assurance program administered to assess the accuracy and precision of the sample data.

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A2. Quality control data for the June 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; na, not applicable]

| Analysis Run               | Standard <sup>1</sup> | Al              | As              | B               | Ba              | Be              | Ca            | Cd              | Ce              | Cl            | Co              | Cr              | Cu              | Dy              | Er              | Eu              | Fe              | Gd              | Hg |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A2. Quality control data for the June 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A2. Quality control data for the June 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A2. Quality control data for the June 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A2. Quality control data for the June 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; na, not applicable]

| Analysis Run       | Standard <sup>1</sup> | Ho              | K               | La              | Li              | Lu              | Mg              | Mn              | Mo              | NH <sub>4</sub> | NO <sub>3</sub> +NO <sub>2</sub> | Na              | Nd              | Ni              | PO <sub>4</sub> | Pb              | Pr              | SO <sub>4</sub> |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A2. Quality control data for the June 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A2. Quality control data for the June 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; na, not applicable]

| Analysis Run               | Standard <sup>1</sup> | Sb $\mu\text{g/L}$ | Se $\mu\text{g/L}$ | $\text{SiO}_2$ mg/L | Sm $\mu\text{g/L}$ | Sr $\mu\text{g/L}$ | Tb $\mu\text{g/L}$ | Tl $\mu\text{g/L}$ | Tm $\mu\text{g/L}$ | U $\mu\text{g/L}$ | V $\mu\text{g/L}$ | Y $\mu\text{g/L}$ | Yb $\mu\text{g/L}$ | Zn $\mu\text{g/L}$ |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A2. Quality control data for the June 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; na, not applicable]

| Analysis Run       | Standard <sup>1</sup> | Sb $\mu\text{g/L}$ | Se $\mu\text{g/L}$ | $\text{SiO}_2$ mg/L | Sm $\mu\text{g/L}$ | Sr $\mu\text{g/L}$ | Tb $\mu\text{g/L}$ | Tl $\mu\text{g/L}$ | Tm $\mu\text{g/L}$ | U $\mu\text{g/L}$ | V $\mu\text{g/L}$ | Y $\mu\text{g/L}$ | Yb $\mu\text{g/L}$ | Zn $\mu\text{g/L}$ |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A3. Quality control data for the September 1999 trip.

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

Table A3. Quality control data for the September 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

| Analysis Run               | Standard <sup>1</sup> | Al $\mu\text{g/L}$ | As $\mu\text{g/L}$ | B $\mu\text{g/L}$ | Ba $\mu\text{g/L}$ | Be $\mu\text{g/L}$ | Ca $\mu\text{g/L}$ | Cd $\mu\text{g/L}$ | Ce $\mu\text{g/L}$ | Cl $\mu\text{g/L}$ | Co $\mu\text{g/L}$ | Cr $\mu\text{g/L}$ | Cu $\mu\text{g/L}$ | Dy $\mu\text{g/L}$ | Er $\mu\text{g/L}$ | Eu $\mu\text{g/L}$ | Fe $\mu\text{g/L}$ | Gd $\mu\text{g/L}$ |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A3. Quality control data for the September 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A3. Quality control data for the September 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

45

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A3. Quality control data for the September 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A3. Quality control data for the September 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A3. Quality control data for the September 1999 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip.

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

| Analysis Run    | Standard <sup>1</sup> | Al $\mu\text{g/L}$ | As $\mu\text{g/L}$ | B $\mu\text{g/L}$ | Ba $\mu\text{g/L}$ | Be $\mu\text{g/L}$ | Ca $\mu\text{g/L}$ | Cd $\mu\text{g/L}$ | Ce $\mu\text{g/L}$ | Cl $\mu\text{g/L}$ | Co $\mu\text{g/L}$ | Cr $\mu\text{g/L}$ | Cu $\mu\text{g/L}$ | Dy $\mu\text{g/L}$ | Er $\mu\text{g/L}$ | Eu $\mu\text{g/L}$ | Fe $\mu\text{g/L}$ | Gd $\mu\text{g/L}$ |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A4. Quality control data for the May 2000 trip – continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]  
 liter; ng/L, nanograms per liter; mg N/L, milligrams per liter as nitrogen]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A5. Quality control data for the September 2001 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

| Analysis Run             | Standard <sup>1</sup> | Hg ng/L   | Ho $\mu\text{g/L}$ | K mg/L    | La $\mu\text{g/L}$ | Lu $\mu\text{g/L}$ | Mg mg/L   | Mn $\mu\text{g/L}$ | Mo mg N/L | NH <sub>4</sub> mg N/L | NO <sub>3</sub> mg N/L | Na        | Nd        | Ni $\mu\text{g/L}$ | PO <sub>4</sub> $\mu\text{g/L}$ | Pb $\mu\text{g/L}$ | Pr $\mu\text{g/L}$ |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A5. Quality control data for the September 2001 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A5. Quality control data for the September 2001 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A5. Quality control data for the September 2001 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A5. Quality control data for the September 2001 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A5. Quality control data for the September 2001 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus; meq/L, milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A5. Quality control data for the September 2001 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg/L}$ , milligrams per liter;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A6. Quality control data for the April 2002 trip.

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

| Analysis Run | Standard <sup>1</sup> | Al $\mu\text{g/L}$ | As $\mu\text{g/L}$ | B $\mu\text{g/L}$ | Ba $\mu\text{g/L}$ | Be $\mu\text{g/L}$ | Ca $\mu\text{g/L}$ | Cd $\mu\text{g/L}$ | Ce $\mu\text{g/L}$ | Cl $\mu\text{g/L}$ | Co $\mu\text{g/L}$ | Cr $\mu\text{g/L}$ | Cu $\mu\text{g/L}$ | Dy $\mu\text{g/L}$ | Er $\mu\text{g/L}$ | Eu $\mu\text{g/L}$ | Fe $\mu\text{g/L}$ | Gd $\mu\text{g/L}$ |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A6. Quality control data for the April 2002 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

| Analysis Run | Standard <sup>1</sup>   | Al $\mu\text{g/L}$ | As $\mu\text{g/L}$ | B $\mu\text{g/L}$ | Ba $\mu\text{g/L}$ | Be $\mu\text{g/L}$ | Ca $\mu\text{g/L}$ | Cd $\mu\text{g/L}$ | Ce $\mu\text{g/L}$ | Cl $\mu\text{g/L}$ | Co $\mu\text{g/L}$ | Cr $\mu\text{g/L}$ | Cu $\mu\text{g/L}$ | Dy $\mu\text{g/L}$ | Er $\mu\text{g/L}$ | Eu $\mu\text{g/L}$ | Fe $\mu\text{g/L}$ | Gd $\mu\text{g/L}$ |

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A6. Quality control data for the April 2002 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg N/L}$ , milligrams per liter as nitrogen;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

<sup>1</sup>Numbers in parentheses represent the number of times the standard was analyzed during the analysis run.

Table A6. Quality control data for the April 2002 trip -- continued

[Values in italics are MPVs for the listed standard; non-italicized values are the median concentrations from each analysis run;  $\mu\text{g/L}$ , micrograms per liter;  $\text{mg P/L}$ , milligrams per liter as phosphorus;  $\text{meq/L}$ , milliequivalents per liter; na, not applicable]

<sup>1</sup> More complete explanations of these are found in table 1 and 2.

<sup>2</sup> Location is the position within the channel where the grab sample was collected.

Table A15. Concentrations of nutrients, dissolved nitrous oxide, dissolved organic carbon (DOC), and suspended sediment in grab samples collected on the Lagrangian trip of June 1999 -- continued

[km, kilometers; Q, discharge; cms, cubic meters per second; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; mg C/L, milligrams per liter as carbon; mg/L, milligrams per liter; m, meter; LEW, left edge of water (facing downstream); COF, center of flow; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1 and 2.

<sup>2</sup> Location is the position within the channel where the grab sample was collected.

Table A16. Concentrations of major ions in grab samples collected on the Lagrangian trip of June 1999.

[km, kilometers; Q, discharge; cms, cubic meters per second; mg/L, milligrams per liter; mg C/L, milligrams per liter as carbon;  $\mu\text{g/L}$ , micrograms per liter; Avg, average; SD, standard deviation; m, meters; LEW, left edge of water (facing downstream); COF, center of flow; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.<sup>2</sup> Location is the position within the channel where the grab sample was collected.

Table A16. Concentrations of major ions in grab samples collected on the Lagrangian trip of June 1999 -- continued

[km, kilometers; Q, discharge; cms, cubic meters per second; mg/L, milligrams per liter; mg C/L, milligrams per liter as carbon;  $\mu\text{g/L}$ , micrograms per liter; Avg, average; SD, standard deviation; m, meters; LEW, left edge of water (facing downstream); COF, center of flow; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.<sup>2</sup> Location is the position within the channel where the grab sample was collected.

Table A17. Concentrations of trace elements in grab samples collected on the Lagrangian trip of June 1999.

[km, kilometers; Q, discharge; cms, cubic meters per second; µg/L, micrograms per liter; ng/L, nanograms per liter; Avg, average; SD, standard deviation; m, meters; LEW, left edge of water (facing downstream); COF, center of flow; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.<sup>2</sup> Location is the position within the channel where the grab sample was collected.

Table A17. Concentrations of trace elements in grab samples collected on the Lagrangian trip of June 1999 -- continued

[km, kilometers; Q, discharge; cms, cubic meters per second; µg/L, micrograms per liter; ng/L, nanograms per liter; Avg, average; SD, standard deviation; m, meters; LEW, left edge of water (facing downstream); COF, center of flow; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Composite samples were taken for the Iroquois River; grab samples were taken from the center of flow for Sugar Creek.

Table A25. Concentrations of nutrients, dissolved nitrous oxide, dissolved organic carbon (DOC), and suspended sediment in samples collected on the Lagrangian trip of May 2000.

[km, kilometers; Q, discharge; cms, cubic meters per second, mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; mg C/L, milligrams per liter as carbon; mg/L, milligrams per liter; MAD, median absolute deviation (Rousseeuw, 1990); <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Both composite and grab samples were taken for Iroquois River; only grabs were taken for Sugar Creek. Grabs were taken from the center of flow.

Table A25. Concentrations of nutrients, dissolved nitrous oxide, dissolved organic carbon (DOC), and suspended sediment in samples collected on the Lagrangian trip of May 2000 -- continued

[km, kilometers; Q, discharge; cms, cubic meters per second; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; mg C/L, milligrams per liter as carbon; mg/L, milligrams per liter; MAD, median absolute deviation (Rousseeuw, 1990); <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Both composite and grab samples were taken for Iroquois River; only grabs were taken for Sugar Creek. Grabs were taken from the center of flow.

Table A27. Concentrations of trace elements in samples collected on the Lagrangian trip of May 2000 -- continued  
 [km, kilometers; Q, discharge; cms, cubic meters per second;  $\mu\text{g/L}$ , micrograms per liter;  $\text{ng/L}$ , nanograms per liter; Avg, average; SD, standard deviation; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Both composite and grab samples were taken for Iroquois River; only grabs were taken for Sugar Creek. Grabs were taken from the center of flow.

Table A27. Concentrations of trace elements in samples collected on the Lagrangian trip of May 2000 -- continued  
 [km, kilometers; Q, discharge; cms, cubic meters per second;  $\mu\text{g/L}$ , micrograms per liter;  $\text{ng/L}$ , nanograms per liter; Avg, average; SD, standard deviation; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Both composite and grab samples were taken for Iroquois River; only grabs were taken for Sugar Creek. Grabs were taken from the center of flow.

Table A27. Concentrations of trace elements in samples collected on the Lagrangian trip of May 2000 -- continued  
 [km, kilometers; Q, discharge; cms, cubic meters per second;  $\mu\text{g/L}$ , micrograms per liter;  $\text{ng/L}$ , nanograms per liter; Avg, average; SD, standard deviation; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Both composite and grab samples were taken for Iroquois River; only grabs were taken for Sugar Creek. Grabs were taken from the center of flow.

Table A27. Concentrations of trace elements in samples collected on the Lagrangian trip of May 2000 -- continued  
 [km, kilometers; Q, discharge; cms, cubic meters per second;  $\mu\text{g/L}$ , micrograms per liter;  $\text{ng/L}$ , nanograms per liter; Avg, average; SD, standard deviation; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Both composite and grab samples were taken for Iroquois River; only grabs were taken for Sugar Creek. Grabs were taken from the center of flow.

Table A28. Field measurements for samples collected on the Lagrangian trip of May 2000.

[km, kilometers; Q, discharge; cms, cubic meters per second; °C, degrees Celsius;  $\mu\text{S}/\text{cm}$ , microsiemens per centimeter; mg/L, milligrams per liter; na, not available]

| Site Name <sup>1</sup>         | Site Location <sup>1</sup>      | Dist. <sup>1</sup> km | Date     | Time  | Type <sup>2</sup> | Q cms | pH   | Temperature °C | Specific Conductance $\mu\text{S}/\text{cm}$ | Dissolved Oxygen mg/L |

<sup>1</sup> More complete explanations of these are found in table 1.

\* These values are estimates.

Table A35. Concentrations of nutrients, dissolved organic carbon (DOC), and suspended sediment in grab samples collected on the synoptic trip of April 2002.

[km, kilometers; Q, discharge; cms, cubic meters per second; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; mg C/L, milligrams per liter as carbon; mg/L, milligrams per liter; MAD, median absolute deviation (Rousseeuw, 1990); Avg, average; SD, standard deviation; COF, center of flow; LEW, left edge of water (facing downstream); m, meters; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Location is the position within the channel where the grab sample was collected.

Table A35. Concentrations of nutrients, dissolved organic carbon (DOC), and suspended sediment in grab samples collected on the synoptic trip of April 2002 -- continued  
 [km, kilometers; Q, discharge; cms, cubic meters per second; mg N/L, milligrams per liter as nitrogen; mg P/L, milligrams per liter as phosphorus; mg C/L, milligrams per liter as carbon; mg/L, milligrams per liter; MAD, median absolute deviation (Rousseeuw, 1990); Avg, average; SD, standard deviation; COF, center of flow; LEW, left edge of water (facing downstream); m, meters; <, less than; na, not available]

<sup>1</sup> More complete explanations of these are found in table 1.

<sup>2</sup> Location is the position within the channel where the grab sample was collected.

Table A37. Concentrations of trace elements in grab samples collected on the synoptic trip of April 2002.

[km, kilometers; Q, discharge; cms, cubic meters per second;  $\mu\text{g/L}$ , micrograms per liter; ng/L, nanograms per liter; Avg, average; SD, standard deviation; COF, center of flow; LEW, left edge of water (facing downstream); m, meters; <, less than; na, not available]
